1. Comparison of india with 5 Nations

→ India is one of the fastest-growing producers of E-Waste in the world. According to the uploaded Paper, India's E-waste generation increased from 1.97 million tonnes in 2015 to 3.23 million tonnes in 2019, representing the highest growth rate among the countries studied.

Compared with China, which is the coorld's largest E-Waste generator, India produces a smaller total volume but is growing at much faster rate. The United States is the 2nd largest generator and has a more developed recycling infrastructure.

Germany and the Uk have strong E waste management systems under the European Union's WEEE Directive, allowing them to formally collect and recycle more than half of their E-waste.

2. Initiatives Taken by India for E-Waste.

→ India has introduced several initiatives to improve E waste management and promote environmentally sound recycling. The government first introduced the E-Waste Rules, 2011, which were later strengthend through the E-waste Rules, 2016, introducing Extended Producer Responsibility (EPR) that makes manufactures resposible for collecting and recycling. More recently the E-Waste Rules, 2022 established a digital EPR portal. The Central Pollution Control Board CPCB monitors Compliances through the online EPR portal, while authorized Collection Centres and recycling facilities.
